

Are you having surgery to remove your gallbladder?

This hospital is taking part in a study called P-iGBC. The study aims to develop a diagnostic model for incidental gallbladder cancer.

Gallbladder cancer is very rare but is sometimes diagnosed after routine surgery. Inclusion in P-iGBC does not mean that you have been identified as high-risk for incidental cancer.

This observational study won't change your care. If included, your clinical team will collect data from your medical record. **This may be done without your consent unless you opt-out.** Anonymised data will be shared with the team co-ordinating the research at University Hospitals Plymouth and the University of Plymouth.

The first phase is led by a senior surgical registrar as part of a doctoral degree.

No-one, apart from your local clinical team, will be able to work out who you are from the data shared with the researchers.

For more information about the study, please go to www.P-iGBC.org, or speak to a member of your surgical team.

You have the right to opt-out if you do not want your information to be used for this study. Please tell your surgeon, or your local study team using the details below.
